### DECLARATION

Based on the external report of TUV Rheinland on compatibility of insulating glass units with various Soudal products, we can write this complementary note.

Soudal Silirub WS is a top quality, neutral cure, silicone specially designed for weather sealing of expansion joints in glass façades.

This product is suitable to be used in contact with the cutting edges of glass.

Soudal Silirub WS may also come into contact with the PVB film for safety glass and the secondary seal (edge sealing) of insulating glass units based on polysulfide (e.g. Fenzi Thiocol) and silicone (e.g. DC 3362).

However, since Soudal has no control over the production of the edge sealing systems and that the suppliers can adapt their composition (without any prior notice or even afterwards) means that results from the past do not give any certainty for future results. Therefore, Soudal cannot give any guarantee on variables of third parties.

Remark: Silirub WS cannot be used for bonding of glass (structural glazing applications).

Also for use on self-cleaning glass, this product is not suitable and other products are available.

For questions about compatibility with other products used in glass constructions our technical department can be contacted. Please always consult and respect the most recent technical data sheet of the products being used.

For Soudal NV
